

17 X 48 CHIRO LONG PANEL

SINGLE EXPOSURE FULL SPINE SOLUTION

17 X 48 ACTIVE AREA

Single Shot Exposure

Detector Technology: Amorphous Silicon

Scintillator: CsI (Cesium)

Pixel Size: 139 micron

Spatial Resolution: 3.6 lp/mm

Our Universal-DR 17" x 48" single exposure, dose reducing, time saving full spine panel. Improving workflow efficiency while improving the patient experience.

Seven years ago, I made the leap from full spine plain film to a 14x17 digital X-ray detector for just under \$40,000. It took a while to get used to taking multiple images, section by section, especially in such a way that I could accurately stitch them together and have good images of the full spine. But the quality of the images were clearly much better right away and the process a little faster! As someone who really values X-ray as a tool, I was overjoyed with the quality. Still there were times when the stitching process was tricky.

I am now using the new digital full spine panel which acquires an image in a single shot, instead of 2-3 individual shots, and no stitching is needed. The acquisition is significantly faster. Both my time in the X-ray room and my time processing and counting are cut by 75%! The result for my business has been great as I can see several more patients in a day or finish all my imaging work and notes earlier. I love it. Thank you 20/20 Imaging!
